WS-4 February 1937

THE WHEAT SITUATION

World wheat prices may be expected to fluctuate near current levels until Southern Hemisphere shipments taper off and then are likely to strengthen somewhat. Increased world demand and a greatly reduced supply are serving to offset to a considerable extent the price-depressing effect of early season Southern Hemisphere shipments. These shipments have reached record proportions this year and are likely to remain heavy until well into March, at which time world prices frequently experience a seasonal rise. It is probable that buying by European importing countries will continue aggressive during most of the remainder of the marketing season.

Domestic prices have been generally higher than world prices during the current season. This relationship is expected to continue until the latter part of April. If, by that time, winter wheat crop prospects, and seedings and moisture in the spring wheat areas indicate a crop materially in excess of domestic requirements, including a replenishment of carry-over stocks, domestic prices may be expected to decline relative to world prices. Any extensive freezing and thawing of the winter wheat crop, of course, will tend to strengthen both domestic and world prices.

The crop outturn of wheat in 1937 will be a very important factor in the world wheat situation. Carry-over stocks on July 1, 1936, were greatly reduced compared with those of the years just preceding, but they were large enough to supplement the small world crop in 1936 so that supplies in surplus producing countries were ample to meet the deficits in importing countries. A small crop again this year will not have a large world carry-over upon which

to draw. There is nothing at this time, however, to indicate that the world crop will be small. While there is a deficiency of moisture in the spring wheat areas of this country and Canada, spring rains and good growing weather would produce a good crop. Kansas, Texas and Oklahoma have been decidedly dry but there was a good snowfall over this area on February 20, the moisture from which, with the frost no out of the ground, will serve to check deterioration. Present indications point to European sowings as large as the record of 1935, and conditions are reported as about average. In India the usual January rains were missed but precipitation in early February relieved the situation. The acreage of wheat in Japan is reported to be about 15 percent larger than last year with conditions fairly good. Southern Hemisphere crops are not planted until late spring and early summer.

It now seems probable that wheat stocks in the United States on July 1, 1937, will be reduced to about 100,000,000 bushels, compared with 136,000,000 bushels a year ago. The carry-over averaged 115,000,000 bushels for the 5-year period, 1924-28, before stocks began to accumulate. The July-June wheat disappearance in continental United States is expected to be about 700,000,000 bushels. This represents an increase of about 40,000,000 bushels compared with the disappearance during the past 2 years, and is the result of increased wheat feeding and seed requirements for a larger acreage, as well as some increase in the amount of wheat milled.

PRICES

BACKGROUND:- World market prices of wheat have been moving steadily upward since the spring of 1933, reflecting higher world commodity price levels, three successive below-average harvests in North America, and last season's short Southern Hemisphere crops. During this same period domestic wheat prices have been unusually high relative to world market prices as a result of four small crops caused largely by abnormally low yields per acre. During the current season, both world and domestic prices have advanced sharply as a result of increased demand and the smallest supplies in recent years.

World and domestic prices during the last half of January, largely as the result of very heavy shipments of Southern Hemisphere wheat, continued the decline which started the early part of the month. For the week ended January 30, prices of No. 2 Hard Winter at Kansas City and No. 2 Red Winter at St. Louis averaged about 4½ cents lower than for the week ended January 16 and about 7 cents lower than for that ended January 2. During the first half of February, however, wheat prices increased sharply as a result of very active European buying, and No. 2 Hard Winter at Kansas City and No. 2 Red at St. Louis averaged 8 and 9 cents higher, respectively, than for the week ended January 30. For the week ended February 20 prices again declined, owing to a pause in the Continental European demand and slow inquiry by United Kingdom millers. The average price of wheat received at United States local (farm) markets on January 15 was 123.6 cents compared with 114.5 cents on December 15 and 92.0 cents, the revised figure for January 1936.

Prices are averages of daily prices for the week ending Saturday except as follows: Berlin prices are Wednesday quotations. Prices at Winnipeg, Buenos Aires, Liverpool, Great Britain, Berlin and Paris are converted to United States money at the current rates of exchange.

1/ No. 2 Hard Red Winter.
2/ No. 1 Dark Northern Spring. No. 1 Heavy for weeks ended January 30 and February 6.
3/ No. 3 Manitoba Northern.
4/ Near futures.
5/ Home-grown wheat in England and Wales.
6/ Central German wheat, wholesale trade price free Central German Station.

The spread between domestic and world wheat prices (table 4) continued to be much narrower than the spread during the corresponding period in the last 3 years when crops were also less than domestic needs. While there has been some recent widening in the spread compared with a month ago, prospects are for no very large change until about the latter part of April when the domestic new crop prospects become a major price factor.

UNITED STATES WHEAT SUPPLY - JANUARY 1 AND JULY 1

BACKGROUND. - The carry-over of wheat in the United States for the 5-year period 1924-28 averaged 115,000,000 bushels. Beginning in 1929, stocks began to accumulate until in 1933 they reached the record peak of 376,000,000 bushels. Four small wheat crops since that time, however, have reduced stocks greatly, so that on July 1, 1936 they were 136,000,000 bushels. Wheat stocks on January 1 amounted to 425,728,000 bushels in 1936 and 435,065,000 bushels in 1935.

Wheat stocks in the United States on January 1, 1937, are estimated at 370,150,000 bushels, which is about 56,000,000 bushels less than a year earlier and 65,000,000 bushels less than at the beginning of 1935. Based on these stocks figures, the wheat disappearance for the July-December 1936 period is estimated at 414,000,000 bushels, which is about 50,000,000 bushels larger

than for the same period in 1934 and in 1935. The increase in disappearance is the result of increases in flour production, wheat feeding, and seed required for the larger winter wheat plantings. The January 1 estimated wheat stocks in the different positions by classes for 1935-37 are shown in table 9 and the July-December estimated total disappearance for the same 3 years in table 10.

It seems probable that the disappearance the last half of the season (January - June 1937) will be smaller than 2 years earlier, when it was 294,000,000 bushels, last year it was 300,000,000 bushels. The amount of seed and feed will probably be about the same as in the January - June period in 1936, but owing to an increase of about 14,000,000 bushels in the amount of wheat ground into flour during July-December, the amount used for flour during the last half of the season is expected to decline by perhaps 10,000,000 bushels compared with January-June 1936. Based on this reasoning, a total disappearance for the entire July-June season is forecast at around 700,000,000 bushels, which is about 40,000,000 bushels larger than for the past 2 years.

Exports of wheat and flour this season have been curtailed as a result of the maritime strike. Exports together with shipments to Alaska, Hawaii and Puerto Rico during July-December 1936 amounted to less than 5,000,000 bushels compared with the light movement of 4,000,000 bushels for the same 6-month period of 1935 and 9,000,000 bushels in that of 1934. With the strike settled and shipping resumed it seems probable that total exports and shipments for the year may reach about 10,000,000 bushels 1/.

Based on the January 1 estimated stocks, exports of about 10,000,000 bushels, and a disappearance of about 700,000,000 bushels, and assuming that July 1 stocks will be reduced to about a minimum, with farm stocks very low, it seems probable that imports for the entire season may reach about 45,000,000 bushels. From July through December imports 2/ amounted to 26,000,000 bushels compared with 21,000,000 bushels for the same period in 1935 and 8,000,000 bushels in 1934. These figures include wheat "unfit for human consumption", which in 1934-35 amounted to 8,000,000 bushels, in 1935-36 to 9,000,000 bushels, and in 1936-37 are forecast at 5,000,000 bushels. Imports of hard red spring and durum wheat have occurred in the past 4 years, when the crops were small as a result of drought and grasshoppers.

On the basis of the above figures and forecasts, the wheat carry-over on July 1, 1937, may be as low as 100,000,000 to 110,000,000 bushels, or the lowest since 1926.

These forecasts are based on available current data and the present outlook, and are, of course, subject to modifications as conditions change.

Table 5 shows the supply and distribution estimates broken down by classes beginning with 1930-31 and including the forecast for 1936-37; the latter are based on a consideration of prospective milling qualities by classes, location of supplies, etc. This table includes revisions in farm stocks, interior mill and elevator stocks, and production made necessary by the census report on acreage.

1/ Includes only exports of domestic wheat and flour made from domestic wheat.
2/ Imports include full duty wheat, wheat paying a duty of 10 percent ad valorem, and flour in terms of wheat.

1/ Interior mill and elevator stocks.
2/ Bureau of Census raised to represent all merchant mill and elevator stocks, including stored for others.
3/ From reports of Foreign and Domestic Commerce of the United States. Imports include full-duty wheat, wheat paying a duty of 10 percent ad valorem, and flour in terms of wheat. Wheat "unfit for human consumption" amounted to 8,000,000 bushels in 1934-35, 9,000,000 bushels in 1935-36, and is forecast at 5,000,000 bushels for 1936-37. 4/ Includes 1,500,000 bushels of United States durum returned from Montreal. 5/ From reports of Foreign and Domestic Commerce of the United States. Exports are regular exports plus shipments to Alaska, Hawaii, and Puerto Rico, and include wheat and flour made wholly from domestic wheat. 6/ Balancing item.

1/ Carry-over at the beginning of the year (Canada, July 31; Argentina, January 1; Australia, December 1 of the previous year) plus production, minus domestic utilization for the year, minus monthly exports to date.

WORLD WHEAT SURPLUSES AND TRADE

BACKGROUND:- Total world supplies of wheat, excluding China and including only net exports from Soviet Russia, averaged 4,100,000,000 bushels for the 5 years, 1923-24 to 1927-28, increased to 4,986,000,000 bushels in 1933-34, then declined sharply, largely as a result of successive years of small production. Total world supplies for 1936-37 are estimated at 4,226,000,000 bushels compared with 4,685,000,000 and 4,507,000,000 bushels for 1934-35 and 1935-36, respectively.

Total world shipments of wheat averaged 751,000,000 bushels for the 5 years, 1923-24 to 1927-28, increased to a peak of 913,000,000 bushels in 1928-29 (July-June), then declined sharply, largely as a result of measures by importing countries to reduce the use of foreign wheat. Shipments were 613,000,000 bushels in 1932-33, 525,000,000 bushels in 1933-34, 536,000,000 bushels in 1934-35, and 489,000,000 bushels in 1935-36.

Present estimates indicate that the surplus of wheat available for export or carry-over on February 1, 1937, in Canada, Argentina and Australia, together with United Kingdom port stocks and quantities afloat, was about 371,000,000 bushels, or 82,000,000 bushels smaller than on February 1, 1936. Estimates by countries are shown in table 6. Wheat supplies available for export or carry-over in Danubian countries on January 1 totaled about 38,000,000 bushels. No exports of significance are expected from Soviet Russia this season; to date a total of only 88,000 bushels has been shipped.

World shipments, July 1936 through February 20, 1937, totaled 378,500,000 bushels, which represents a material increase over the 314,100,000 bushels for the same period a year earlier and 347,400,000 bushels 2 years earlier. New crop shipments from Argentina have established a new record with a total of 48,000,000 bushels from January 3 through February 18. These, together with Australian shipments of 19,000,000 bushels, combine to make 67,000,000 bushels, which has been exceeded in only 3 years during the post-war period. The quality of the Argentine wheat is well above average and is being purchased by European millers in place of the higher priced Manitobas which are usually used to blend with domestic soft wheats. The quality of the Australian crop is also well above average although not up to that of last year.

During the past month active buying by Germany has been an important price influence. Spain also entered the market after authorizing the importation of around 11,000,000 bushels of cash wheat.

AREA AND CONDITION OF FALL SOWN WHEAT

The acreage sown to winter wheat in 12 countries, for the 1937 harvest, is shown in table 7. Indications point to total European sowings as large as the record of 1935, when 79,000,000 acres were sown. The favorable weather for fall sowing, which prevailed over most of Europe, coupled with present price levels, resulted in increased acreage in most countries. In the estimates received to date, increases are noted for all but three European countries, Czechoslovakia reports an 11 percent decrease from last year and Poland a 3 percent decrease. Although definite estimates are not available for Italy, Portugal and the Danubian countries, reports indicate that acreage has been increased considerably.

Throughout Eruope, conditions are about average. In France the weather has been mild and crops are too advanced; some frost damage has been reported. Heavy rains have caused some flooding, but damage is not considered serious. In Germany alternate freezing and thawing are thought to have damaged the crop to some extent. Crop conditions in the Balkans are reported to be good. Russia has sustained severe frosts but the snow cover is believed to be sufficiently heavy for protection in most sections. The outlook in Italy is reported as generally favorable. The official condition of the crop in Poland on January 15 was 2.9, or a little less than fair, but since that time severe frosts are reported to have resulted in some additional damage. Excessive rainfall in parts of England and Wales has done considerable damage to the crop. In India the usual January rains were missed and deterioration of the crop was feared, but during the early part of February widespread rain relieved dryness and checked further damage. The acreage of wheat in Japan is reported to be about 15 percent larger than last year and the condition of the seedings fairly good.

Table 7.- Area sown to winter wheat in specified countries for harvest in 1935, 1936 and 1937

2/ Sowings to January 1.
3/ Based on a reported 6 percent increase.

AREA OF FALL SOWN RYE

The total of the eight European countries reporting acreage of winter rye sown, is slightly larger than the acreage sown in these countries a year ago but somewhat below that of 1935. Of the eight countries, four show increases and four, decreases in acreage.

Table 8.- Area sown to winter rye in specified countries for harvest in 1935, 1936 and 1937

THE DURUM WHEAT SITUATION

BACKGROUND:- Until recent years a very considerable part of the durum wheat produced in the United States was exported, with prices depending chiefly upon export markets. During the last 3 years, largely because of drought, production has been reduced to less than domestic requirements and prices have advanced to an import basis. The 1934-35 imports amounted to 5,000,000 bushels and 1935-36 to 4,000,000 bushels. The six countries which produce durum wheat in sufficient quantities to affect the international situation are the United States, Canada, Italy, Algeria, Morocco and Tunisia.

Durum supplies in the United States this season are again below domestic requirements and prices have been high enough again to result in imports. Moreover, short supplies in Canada and in the Mediterranean countries have resulted in active competition for the small offerings in world markets and have caused prices to advance to the highest level since 1925.

United States durum supplies this season are the shortest of any year for which data are available. The 1936 production was the smallest on record with the exception of the drought year of 1934, and amounted to only 9,000,000 bushels, which, together with the carry-over stocks of about 8,000,000 bushels, resulted in a total supply of only about 17,000,000 bushels. This was about the same as in 1934 when it was 15,000,000 bushels, but much less than the 31,000,000 bushels in 1935. Table 5 shows the supply and distribution estimates of durum beginning with 1930-31 and includes forecasts for the current season. Table 11 shows production beginning with 1919.

Canadian durum supplies also are short this season, although slightly above the small supplies of 1935. Production totaled 18,846,000 bushels compared with 17,800,000 bushels in 1935. Carry-over stocks were apparently somewhat larger than those of a year earlier, with stocks in store on August 1 in commercial channels amounting to 4,118,000 bushels compared with 3,225,000 bushels a year earlier, in addition to quantities remaining on farms and in country elevators. Crops in the Mediterranean countries were well below those of other recent years, while carry-over stocks were also very small.

World trade in durum wheat is currently at a very low level. The bulk of the Canadian surplus has been shipped to the United States while European imports have been held to a minimum through scarcity of offerings and relatively high prevailing prices.
